

IN THE CLAIMS

1. (Currently Amended) A ball carrier device for use with a wheeled vehicle having handle bars, wherein the carrier device comprises:

a main strap member having opposed surfaces joined together to form an enlarged central loop and a pair of opposed auxiliary loops, wherein the auxiliary loops extend from diametrically opposed spaced surfaces of the central loop, and are disposed to be slipped over opposite ends of the handle bars of the wheeled vehicle; and

a plurality of sling strap members each having opposed ends connected to diametrically opposed surfaces on the central loop portion of the main strap member, wherein all of the sling strap members intersect each other and are connected to one another proximate their respective midpoints.

2. (Canceled)

3. (Currently amended) The ball carrier device as in claim [2] 1, wherein said plurality of sling strap members comprise at least three sling strap members.

4. (Previously presented) The ball carrier device as in claim 3, wherein all of said strap members are fabricated from flexible material.

5. (Previously presented) The ball carrier device as in claim 3, wherein all of said strap members are fabricated from resilient material.

6. (Previously presented) The ball carrier device as in claim 3, wherein all of said strap member are fabricated from flexible and resilient material.
